Edition 03.2019

Technical information should always be available to the foremen and mechanics, because their careful and constant adherence to the instructions is essential to ensure vehicle road-worthiness and safety. In addition, the normal basic safety precautions for working on motor vehicles must, as a matter of course, be observed.

1 Introduction

(VRL012846; Edition 03.2019)

WARNING

The information contained herein is a reference for the importer, since the material cited in this Manual may not exist on the market.

2 Safety at the working area

2.1 Product handling

The efficiency of a painting and repainting operation requires attention to all stages of preparation and safety of the process. A few basic rules to reach the best results are described below:

- Do not smoke in the areas reserved for repainting, as well in the paint storage location. Avoid repaints at locations with risk of sparks, high temperatures or flames.
- 2 2 The floor should be slip-resistant and oil-free, grease and other slippery substances.
- %3 -The area indicated for painting must feature signalled emergency doors, as well as firefighting equipment (extinguish-
- e1010 Store the paint and solvent cans covered and in an appropriate location, well organized and ventilated, so as to protect the products against sparks.
- Always read with attention the instructions on the packaging 5 labels.
- Use personal protective equipment (PPEs): gloves, safety boots, safety goggles, aprons, facial masks and facial and ear protectors.
- It is an environmental crime to dump residues (painting cabin smudge, solvents, paints and flammable products) on the ground, in the water or the air.
- The appropriate disposal of residue must be carried out according to guidelines from the competent organisms.
- Never store food along with chemicals.

2.2 Wear individual protection equipment (IPE)

More than an obligation, Individual Protection Equipment (IPE) must be indispensable working tools during the execution of an automotive repair work. Aiming at preventing accidents, these items become mandatory equipment. The IPEs are tools that ensure the integrity of the worker.

For automotive repair, the main IPEs use are:

Protection Goggles

During activities of tack welding, grinding and surface smoothing down, the worker exposes himself or herself to chips of the part, that may occur during this type of work. When handling chemical, the goggles also prevent the contact of chemicals that may attack vision, and are, therefore, great allies in avoiding damages to the eves.

Note

If necessary, consult the eye doctor on more appropriate glasses or contact lenses.

Gloves and Shoes

The gloves are important both for the preparation of products and for the use of them, and protect the painter's skin against the action of chemicals. They offer safety and comfort to the tinker in his

or her activities. The flanges and corners of the plates make the risk of cutting your hands even larger. Another function of the gloves is to offer more sensitivity to recognize defects on the surfaces of the parts. They should not be used during M.I.G. / M.A.G. welding activities. / M.A.G.

The shoes with slip-resistant soles are also worn for the protection of the feet, in case of falling objects or tools.

Protection masks of the air ways

ath respect to the correctness of information in this cook. Indicated for the protection against impurities launched in the environment during the execution of works involving painting, dry grinding and welding.

Masks with activated carbon should be worn.

Ear Protectors

Mandatory use in environments with a noise level above 85dB (decibels). There are four types:

- Plug type, in PVC 3 sizes (disposable)
- 2 -0 Cylindrical mouldable foam type (disposable)
- Conical mouldable foam type (disposable)
- Shell type

Facial Protector

When grinding requires a larger smoothing down, it is necessary to wear a facial protector, since debris resulting from this type of work are much larger and fly at a much higher speed than normal.

2.3 Important safety items in the repainting workshop

2.3.1 Fire extinguishers

These are indispensable pieces of equipment and their presence is mandatory in workshops. They must be annually loaded and inspected every month.

The types of extinguishers vary according to their use in:

Class A Fire

Fire derived from solid combustible material (paper, cloth, plastic, etc. that burns deeply and on the surface, and leaves residue. In case of this type of fire, use a pressurized water type extinguisher that will extinguish fire by cooling.

Class B Fire

Fire derived from flammable combustible liquids and leaves no residue and burn on the surfaces (paints, solvents, thinners, etc.). Use Dry or CO Chemical Powder extinguisher that will extinguish the fire by smothering.

Class C Fire

Fire derived from electrical risks (sparks), originating from energized equipment (sockets, electrical panels, wiring, etc.). Use Chemical Powder or CO₂ extinguisher, that will extinguish the fire by smothering.

Note

Ventilation

It handling or application environmental ventilation, as the concentration of so.
If a harmful to health, is a source of ignition, ions may occur.

Storage of chemicals

It ostore the material used in the painting of the vehicle in exparate, covered and ventilated location, in metallic cabinets.

1.4.1 Grounding of AG. Volkswagen AG does not consider the parate of the parate of the products and the sockets must be grounded.

2.4.2 Electrical Installations

In order to prevent risks of static electricity, all pieces of equipment must be grounded.

2.4.2 Electrical Installations

In ground be in metallic conduits and the sockets must be produced against solvent vapours. The lamps must red against accidental hits and, in the painting area they required, to avoid solvent vapours.

Pation of the painting section

I use of flammable products, the painting away from the welding, spark, flame lovely have partition walls.

In disposal of paints

future generations, caring for our water, air, earth and all living beings in our environment. future generations, complete future generatio .DA nolkswagen AG.

2.5.1 Residues

Residues are grout, sludge, contaminated packaging, contaminated papers, remains of paint, etc.; in other words, everything that is left over during a repainting process an has not been reused.

In the workshop, these are the type of residues that will present risk to the environment if their disposal is not appropriate. The workshop must prepare to carry out the disposal of each one of these items:

- Paint leftovers
- Dirty cleaning solvents
- Empty dirty packaging
- Contaminated paint filters

- The reuse of chemical packaging for any purpose is prohibi-
- Check the condition of conservation of packaging, before you handle it.
- Drums shall never be opened by using welding torches and chisels, especially those that contain flammable products

Do not use flammable liquids to clean the skin or pieces of equipment, especially those in movement or heated.

5 **Paints**

Paint is a pigment liquid, produced from the dispersion of solvents, resins and pigments. Ones it is applied to a surface, the paint forms an adherent film that provides colour, shine and protection to the vehicle.

5.1 Basic composition of paints

Resin

ns as aliquic, erence of the p, of paint (Polyeste, and Synthetic).

.nely ground (in the form of pow which provides to the dry film cer, olour, opacity, covering and protectic anti-corrosive properties asent in the composition of base paints (primer, ie property of blocking rust.

. to the paint in small quantities to confer special properah as spread, gloss etc. The additives also have the anti-prevent problems such as blisters, pits (fish eye) etc.

.ent

.ent

.ed for binding (mixture) of the pigment to the resining to controls iscosity, spread and application. The film is formed after their notations, seven and application. The film is formed after their notations, seven and polyer and properties.

5.2 Types of paints

For repainting, fourtypes of paint may be applied: Synthetic Ennel, Polyurethane (PU) Enamel and Polyester Based.

**hetic Enamel*

**ved of resin with glossy finish.

nail technology

q

**also known as PU paint. It needs a carried and drying.

**Vitic converter*

**her*

**Universal to the properties of the properties of the paint of the properties of the properties of the paint of the properties of

over the paint in order to gain brightness and resistance, and will then have characteristics similar to those of PU paint.

- ♦ High technology
- Quick drying
- No resistance to chemicals or weather (without the application of varnish)
- Mat (without the application of varnish)
- ◆ Smooth (solid), metallic or pearly colours

Polyurethane (PU) Varnish

Its application is necessary after the painting with polyester base, since this paint does not feature sufficient brightness or resistance to weather. It needs a catalytic converter for application and dry-

Note

Varnish must be catalysed according to manufacturer's recommendation.

6 Complements

These are auxiliary products use in repainting:

- ♦ Thinners / Solvents / Diluents ⇒ page 168
- ♦ Rust neutralizers ⇒ page 168
- Sealing and protection of the lower part of the vehicle (paste for body repair) ⇒ page 168
- ◆ Grinding control ⇒ page 169
- ◆ Primers ⇒ page 169
- Polyester paste ⇒ page 169
- Single-component polyurethane sealants ⇒ page 169
- ♦ Abrasives ⇒ page 170

6.1 Thinners / Solvents / Diluents

Thinner, in English, means a viscosity reducer. Basic functions: reduce the viscosity of paint (make paint thinner), thus allowing a better application of the paint, as well as spread and drying. Thinner evaporates totally after the drying of the paint. Depending on the region or the manufacturer, thinner is also commercialized with the denominations of Reducer, Solvent or Diluents.

6.1.1 Basic composition

Thinner is normally a solution originated from the mixture of several raw materials derived from petroleum (aromatic carbides), several types of acetate and ethanol.

6.1.2 Types of thinners

There is a specific thinner for each type of paint. Use thinner according to manufacturer's specification. Never use thinner that is not indicated, as this may render useless the properties of the paint, and may compromise the paint. If in doubt, consult the reseller or the manufacturer.

There are also thinners and solvents specifically used for cleaning guns or parts.

6.2 Rust neutralizers

During the treatment of the surface to be painted, all traces of rust must be eliminated by grinding or with steel brushes. Once the gross rust is eliminated, a rust neutralizer or deoxidant has to be applied, as described by the manufacturer.

6.3 Sealing and protection of the lower part of the vehicle

Product is based on acrylic emulsion, water and additives.

Application

Gun for application.

Use

indicated for protection of the lower parts of the vehicle (floor, mud-flap) against the action of rain, sea mist and impact of stones. Reduces the effects of vibrations and provides additional protection to doors, luggage compartment, floors, and other parts, against noise and corrosion.

Hints

- In order to obtain better adherence, always apply sealing and protection over a primer.
- Clean the gun with water.

Sanding control

Product used to control sanding of paste and primer. Facilitates viewing of conditions of the surface for application of the following

6.5 Primers

Products used in surface preparation to receive the finishing.

6.5.1 PU Primer

High-technology products, used for surface stuffing, levelling it according to the irregularity shown. Provides good insulation of other layers and ensures adherence of paint to the finishing.

Polyester paste

Putties are products used for the repair of small surface imperfections.

Application

- Manual applicator (celluloid)

Use

Jesus good insulation of paint to the finishing.

May only be apw bubbles and

Aste in thin

solvents.

We have the finishing of the finishing - For correction of small surface imperfections. May only be applied over primer, since if otherwise, it may show bubbles and debonding.

- In order to obtain better drying, always use the paste in thin layers.

6.6.1 Body repair paste

Rubber-base paste and synthetic resins dispersed in solvents.

Application

- Brush or scraper.

Use

- For the caulking of bodies, floors, gaskets and slots of automobiles to prevent the penetration of water and dust.

6.6.2 Polyurethane-based sealing adhesive (thread)

Single-component PU adhesive

Application

Method of Application: Directly from the product packaging, using the application gun or the pneumatic applicator. Surfaces must be free of oil residues.

Used to seal body panel joints against the penetration of water and dust.

7 Repainting

7.1 Paint Repair

7.1.1 General information

The condition for a good craft painting is that the workplace, the tools and the pieces of equipment are always in clean condition. In order to keep the paint as free from dust as possible, it is indispensable to install a good ventilation and exhaust system.

This is also necessary in order to prevent the formation of explosive mixtures of air and vapours of solvent. In the painting cabinet (painting compartment) there should be a permanent overpressure. Therefore an airflow speed of 0,3 m/s is sufficient. Greater speeds results in failures in the process, such as: loss of brightness, formation of creases and excessively fast surface drying.

The products must be maintained and handled according to manufacturer's instructions, to prevent the emergence of failures in the process or drying and to maintain the warranty against perforation due to corrosion.

The ambient temperature must be between 20 and 25 °C. Lower or higher temperatures may cause pores and a poor-quality process. High air humidity may result in damages to paint, such as: stains in the paint layer (matt layer), lack of adherence and depressions.

Treatment principles:

- The part to be painted may not contain remains from sanding and salts.
- The humidity of sanding must dry well. This takes approx. 2 hours at an ambient temperature of +20 °C.
- ♦ The part to be painted must be clean, without oiliness and dry.
- Also avoid and remove sweat from the hands on the part to be painted.
- The part to be painted must be at the same temperature of the environment at the time of application of the material, this way condensation of water is prevented.
- The air spray must be dry. Oil and water drip trays must be emptied and controlled at regular intervals.

7.2 Paint repair on steel plates and zinccoated steel plates

The principle of a painting without any problem depends on the correct preparation of the base. Undamaged new parts are supplied by P&A with primer applied, and may already receive the base (colour) and varnish.

Whith respect to the correctness of information in this occ

through the regulation of the is chosen. A spray cone as a high concentration of remell. The compressed is also determined by the size of the drops.

Assure = small paint drops

If the spray regulation it is possible to continuously regulate round spray to plain spray. In the round spray, the air leaves of the drops.

Assure = small paint drops

If the spray regulation is provided in the spray in the central hole in the air cap. The air channels in the air cap. The air channels in the air cap. The air channels in the air cap are closed by the regulation screw. The plain spray, the air channels in the air cap are closed by the regulation screw. The spray in the form of a cone may dow be conformed in the form of an elipse until the plain spray. By additionally turning the air cap, the spray may come out either vertically or horizontally.

In the plain the plain spray, the air channels to require large baffle to be used heavy filling materials require large baffle to be used heavy filling materials require large baffle to be used heavy filling materials require large baffle to be used. The plain the plain spray filling materials require large baffle opening.

In the plain the plain spray, the air cap, the spray may come out either vertically or horizontally.

In the plain the plain spray is the plaintenance of the plaintenance of the material and the plaintenance of the plain

Several types of spray guns are offered, all designed for specific types of work. They must meet the following criteria:

Reduced weight

- Good ergonomics and handling
- ◆ Tireless work and with little physical effort

Cup gun for gravity flow

It is a gun with an enamel cup installed on top. The material reaches the baffle via the force of gravity. At the outlet, the compressed air spray causes a vacuum at the outlet of the can in front of the paint baffle. This vacuum sucks the enamel, which in front of the paint baffle. This vacuum sucks the enamel, which in front of the paint baffle. This vacuum sucks the enamel, which is the paint of the p paid so that the pressure compensating hole on the container cover is always open.

Suction cup gun

It is a gun with an enamel cup installed at the lower end. The operation of this gun is almost identical to that of the flow cup gun, via gravity. In this case the enamel is also sucked from the paint cup by the vacuum generated by a compressed air spray.

This type of gun is mainly used in the industrial area, for painting trucks or buses. In this case, the material is conveyed to the spray gun under pressure, as the paint baffle and the air baffle end um aligned, so there is no vacuum to such the material from the cup. This gun is also used for heavy painting material, or to facilitate the constant refilling of the enamel cup, on large surfaces.

Designer spray gun Protected by copyright, Copyright

This gun is used for the manifold painting of Design and Airbrush. The amount of material of this round spray gun may be changed continuously, hence it is also usable to draw finer lines. The sizes of the baffles are from 0.2 to 1.0 mm, and may be also used for enamels that are soluble in water.

HVLP (NR) Gun

- H = High
- L = Low
- P = Pressure (Sprayer)
- NR = Reduced cloud

This high-performance gun forms a soft, fine and homogeneous spray. The reduced pressure of 0.7 bar provide a high index of material application with a reduced cloud. The reduced internal pressure of the baffle reduces the regression of the droplets of enamel from the object and so also the parcel of "Overspray". At the same time, less solvent evaporates into the atmosphere. This allows for a wide and uniform application of enamel for high-quality surfaces. It application is primarily intended for water-soluble enamels. However, even in the conventional field it provides excellent results in work with coating and base enamels, as well as with colourless enamels. With the high performance of material, it obtains savings of up to 15% with the coating enamels The higher productivity thus obtained has also a positive effect on the environmental sociability and the working conditions.

According to a study of the Residue Handling Consultant Baden Württemberg (ABAG), the advantages are:

- High degree of productivity of the application
- Reduced Overspray
- Lower consumption of material
- Lower emissions of solvent
- Reduced volume of waste products
- Higher durability of the filters
- Lower maintenance of the painting systems
- Lower waste sanitation costs

Cleaning of spray guns (painting system with a solvent base)

In order to ensure the good operation of the spray guns for a long time, a careful cleaning is necessary after each use. Otherwise the paint material may dry in a short time, and later its removal is very difficult.

Manual cleaning:

- After use, clean the enamel cup immediately
- Rinse the gun with diluent
- e qir. .ĐA negewexlo V td htghtqo. For a careful cleaning the gun must be disassembled
- Clean the air cap with an appropriate brush
- ♦ For holes and baffles, use only baffle cleaning needles

Automatic gun washing system (paint system with solvent base)

This consists of an hermetically close chamber. The guns and tools to be cleaned are placed in this chamber. After closing the cover, a pneumatic pump is turned on, which distributes the cleaning product in the system. After the cleaning process is finished or when the cover is opened, the pump is turned off.

Note

After cleaning the spray gun, remove the diluent in order not to damage the sealing and gaskets.

7.5 Paint dryers by irradiation

These are used mainly for small paint repairs. They require little space and have low operational costs. They are called fixed dryers. Presently dryers via infrared rays are predominantly used. Great improvements are obtained in the paint drying process with them. The infrared rays cross the air and the enamel layer, without direct heating. The steel plate is heated and transmits the heat to the enamel layer.

Note

In order to dry the paint on high-resistance plates, by using the infrared ray dryers, these may be taken to full power only slowly. Otherwise excessively quick heating of the plates causes dilation which later, after cooling down, causes undulations in the bonding or spot-welding area.

Fox 2004 ➤ , Fox 2010 ➤ , Fox 2014 ➤ , Gol 1995 ➤ , Gol 1999 ➤ , Gol ... Painting Manual - Edition 03.2019

Advantages of the infrared technique:

- The drying process occurs from the inside to the outside
- The flash-off time is shorter than with hot-air systems
- Quicker drying reduces the risk of dust deposition
- Efficient use of energy

The IV dryers are divided into three groups:

- Short-wave dryer
- Medium-wave dryer
- Long-wave dryer

The most adequate ones for the drying process are the shortwave and medium-wave dryers.

ing

If 80 cm,

JA Negrotion Walter and the content of the content The short-wave appliances generate the irradiation through quartz tubes. They irradiate in the field of vision and emit a red or orange light. It reaches the working temperature in a few seconds. These appliances have an intensive irradiation with a short flashoff time:

The medium-wave dryers generate the rays by means of ceramic tubes. They irradiate in the non-visual field. They only reach the working temperature after a few minutes. Hence the flash-off times are longer than those with short-wave dryers.

In principle, all materials can be dried with the infrared drying technique.

The flash-off time of the infrared dryers, at a distance of 80 cm, comprises:

- Polyester scraper = 2 minutes
- Painting scraper = 2 7 minutes
- Soluble stuffing base in water = 7 9 minutes
- Base = 3 8 minutes
- Covering painting = 7 10 minutes

7.6 Dryers based on air insufflation (waterbased painting)

These are used mainly for small paint repairs. They require little space and have low operating costs, they insufflate air (Dry jet, for example). With them, great improvements in the drying of the paint process are obtained.
